

Measurements and Moles

- qualitative analysis - determination of chemical and physical properties
- quantitative analysis - determination of chemical amounts and composition

Measurements and Units

- measurements - quantitative observations
- units - standards used to compare measurements (yard→standard for comparison of length measurements)

2.1 The SI System

- Based on the metric system (France)
- SI base units

quantity = number × unit

5.5 seconds = 5.5 × 1 s

Table 2.1 SI base units

Quantity	Base unit
length	1 meter (1 m)
mass	1 kilogram (1 kg)
time	1 second (1 s)
electric current	1 ampere (1 A)
temperature	1 kelvin (1 K)
chemical amount	1 mole (1 mol)
luminous intensity	1 candela (1 cd)

2.2 Prefixes for Units

- Prefixes
 - denote powers of 10
 - can be used with any unit

$$1 \text{ mm} = 10^{-3} \times (1 \text{ m}) = 10^{-3} \text{ m}$$

$$1 \text{ MW} = 10^6 \times (1 \text{ W}) = 10^6 \text{ W}$$

$$1 \mu\text{s} = 10^{-6} \times (1 \text{ s}) = 10^{-6} \text{ s}$$

$$1 \text{ ng} = 10^{-9} \times (1 \text{ g}) = 10^{-9} \text{ g}$$

Table 2.2 Common SI prefixes

Prefix	Name	Meaning
G	giga	10^9
M	mega	10^6
k	kilo	10^3
d	deci	10^{-1}
c	centi	10^{-2}
m	milli	10^{-3}
μ	micro	10^{-6}
n	nano	10^{-9}
p	pico	10^{-12}

2.3 Derived Units

- Derived from the base units
 - volume (V) → $1 \text{ m}^3 = (1 \text{ m}) \times (1 \text{ m}) \times (1 \text{ m})$
 $1 \text{ mL} = 1 \text{ cm}^3 = (1 \text{ cm}) \times (1 \text{ cm}) \times (1 \text{ cm}) = (10^{-2} \text{ m}) \times (10^{-2} \text{ m}) \times (10^{-2} \text{ m}) = (10^{-2} \times 10^{-2} \times 10^{-2}) \text{ m}^3 = 10^{-6} \text{ m}^3$
 - density (d) → mass (m) per unit volume (V)
 → $(d = m/V)$
unit of d = (1 kg)/(1 m³) = 1 kg/m³
 - velocity (v) → distance (l) per unit time (t)
 → $(v = l/t)$
unit of v = (1 m)/(1 s) = 1 m/s

- extensive properties - depend on sample size (mass, volume, length, ...)
- intensive properties - independent of sample size (density, temperature, color, ...)

Examples:

- What is the density of an alloy, if 55 g of it displace 9.1 mL of water?
 $d = m/V = (55 \text{ g})/(9.1 \text{ mL}) = 6.0 \text{ g/mL} = 6.0 \text{ g/cm}^3$
- What is the mass of 7.3 cm³ of this alloy?
 $m = V \times d = (7.3 \text{ cm}^3) \times (6.0 \text{ g/cm}^3) = 44 \text{ g}$

2.4 Unit Conversions

- Systems of units (metric, English, SI, ...)
- Equalities between units
 - $1 \text{ in} = 2.54 \text{ cm}$
 - $1 \text{ km} = 10^3 \text{ m}$
- Conversion factors - ratios between two equal or equivalent units (derived from equalities)
 - $[1 \text{ in}/2.54 \text{ cm}]$ or $[2.54 \text{ cm}/1 \text{ in}]$

- Unit conversions (old unit $\rightarrow$ new unit)
 - quantity remains the same; units change
- new unit = (old unit) $\times$ (conversion factor)**
- conversion factor = (new unit)/(old unit)**
- new unit = old unit $\times$ [new unit / old unit]**
 - the old units cancel

Example:

- Convert **5.13 inches** in **centimeters**.

old unit $\rightarrow$ in new unit $\rightarrow$ cm
 $1 \text{ in} = 2.54 \text{ cm} \rightarrow$ conversion factor = $[2.54 \text{ cm}/1 \text{ in}]$
 $5.13 \text{ in} \times [2.54 \text{ cm}/1 \text{ in}] = 5.13 \times 2.54 \times (\text{in} \cdot \text{cm}/\text{in}) = 13.0 \text{ cm}$

Fig. 2.4

Example:

- Two cities are **250 mi** apart. What is this distance in **km**?
- 1 km = 0.6214 mi**
- $250 \text{ mi} \times [1 \text{ km}/0.6214 \text{ mi}] = 402 \text{ km}$**

Example:

- Convert the speed of sound, **332 m/s**, to **km/hr**.
- $\Rightarrow$ need to convert both the numerator and denominator
- m $\rightarrow$ km and s $\rightarrow$ hr**
- $1 \text{ km} = 10^3 \text{ m}$ and $1 \text{ hr} = 60 \text{ min} = 3600 \text{ s}$**
- $332 \text{ m/s} \times [1 \text{ km}/10^3 \text{ m}] \times [3600 \text{ s}/1 \text{ hr}] = 1195 \text{ km/hr}$**

Example:

- Convert the density of gold, **19.3 g/cm³**, to **kg/m³**.
- $\Rightarrow$ need to convert both the numerator and denominator
- g $\rightarrow$ kg and cm³ $\rightarrow$ m³**
- $1 \text{ kg} = 10^3 \text{ g}$**
- $1 \text{ cm} = 10^{-2} \text{ m} \Rightarrow 1 \text{ cm}^3 = (10^{-2})^3 \text{ m}^3 = 10^{-6} \text{ m}^3$**
- $19.3 \text{ g/cm}^3 \times [1 \text{ kg}/10^3 \text{ g}] \times [1 \text{ cm}^3/10^{-6} \text{ m}^3] =$**
- $= 19.3 \times 10^3 \text{ kg/m}^3$**
