

## 13.4 Expressing Solute Concentration

- **Concentration** – the ratio of the quantity of solute to the quantity of solution (or solvent)

Table 13.5 Concentration Definitions

Concentration Term	Ratio
Molarity ( $M$ )	$\frac{\text{amount (mol) of solute}}{\text{volume (L) of solution}}$
Molality ( $m$ )	$\frac{\text{amount (mol) of solute}}{\text{mass (kg) of solvent}}$
Parts by mass	$\frac{\text{mass of solute}}{\text{mass of solution}}$
Parts by volume	$\frac{\text{volume of solute}}{\text{volume of solution}}$
Mole fraction ( $X$ )	$\frac{\text{amount (mol) of solute}}{\text{amount (mol) of solute} + \text{amount (mol) of solvent}}$

- **Molarity ( $M$ )** – the number of moles of solute per 1 liter of solution

$$M = (\text{mol of solute})/(\text{liters of solution})$$

- $M$  is affected by temperature (the solution volume changes with  $T$ , so  $M$  changes too)
- The solution volume is not a sum of the solvent and solute volumes (it must be measured after mixing)

- **Molality ( $m$ )** – the number of moles of solute per 1 kilogram of solvent

$$m = (\text{mol of solute})/(\text{kilograms of solvent})$$

- $m$  is not affected by temperature (the amounts of solute and solvent don't change with  $T$ )
- The solution volume is not needed;  $m$  can be calculated from the masses of solute and solvent

- $M$  and  $m$  are nearly the same for dilute aqueous solutions since 1 L of water is about 1 kg, so (liters of solution)  $\approx$  (kg of solvent)

**Example:** Calculate  $M$  and  $m$  for a solution prepared by dissolving 2.2 g of NaOH in 55 g of water if the density of the solution is 1.1 g/mL.

$$\text{mol solute} = 2.2 \text{ g NaOH} \times \frac{1 \text{ mol NaOH}}{40 \text{ g NaOH}} = 0.055 \text{ mol}$$

$$m = \frac{0.055 \text{ mol NaOH}}{0.055 \text{ kg water}} = 1.0 \frac{\text{mol}}{\text{kg}} \rightarrow \boxed{1.0 \text{ m}} \text{ (molal)}$$

$$\text{Volume} = \frac{\text{mass}}{\text{density}} = \frac{2.2 \text{ g} + 55 \text{ g}}{1.1 \text{ g/mL}} = 52 \text{ mL}$$

$$M = \frac{0.055 \text{ mol NaOH}}{0.052 \text{ L solution}} = 1.1 \frac{\text{mol}}{\text{L}} \rightarrow \boxed{1.1 \text{ M}} \text{ (molar)}$$

- Parts of solute by parts of solution

### ➤ Parts by mass

- **Mass %** – grams of solute per 100 grams of solution  $\rightarrow$  % (w/w)

$$\text{Mass}\% = \frac{\text{mass of solute}}{\text{mass of solution}} \times 100\%$$

- **ppm** or **ppb** – grams of solute per 1 million or 1 billion grams of solution (for trace components)

### ➤ Parts by volume

- **Volume %** – volume of solute per 100 volumes of solution  $\rightarrow$  % (v/v)

$$\text{Volume}\% = \frac{\text{volume of solute}}{\text{volume of solution}} \times 100\%$$

– **ppmv** or **ppbv** – volume of solute per **1 million** or **1 billion** volumes of solution (used for trace gases in air)

➤ **Mole fraction (X)** – ratio of the # mol of solute to the total # mol (solute + solvent)

$$X = \frac{\text{mol of solute}}{\text{mol of solute} + \text{mol of solvent}}$$

**Example:** Calculate the *X* of NaOH in a solution containing **2.2 g** of NaOH in **55 g** of water.

$$2.2 \text{ g} \frac{1 \text{ mol}}{40 \text{ g}} = 0.055 \text{ mol NaOH}$$

$$55 \text{ g} \frac{1 \text{ mol}}{18 \text{ g}} = 3.1 \text{ mol H}_2\text{O}$$

$$X = \frac{0.055 \text{ mol}}{0.055 \text{ mol} + 3.1 \text{ mol}} = 0.018$$

• Converting units of concentration

**Example:** A sample of water is  $1.1 \times 10^{-6} \text{ M}$  in chloroform ( $\text{CH}_3\text{Cl}$ ). Express the concentration of chloroform in **ppb**. (Assume density of 1.0 g/mL)

$$1.1 \times 10^{-6} \text{ M} \rightarrow 1.1 \times 10^{-6} \text{ mol CH}_3\text{Cl per 1 L solution}$$

$$1.1 \times 10^{-6} \text{ mol CH}_3\text{Cl} \times \frac{50.5 \text{ g CH}_3\text{Cl}}{1 \text{ mol CH}_3\text{Cl}} = 5.6 \times 10^{-5} \text{ g CH}_3\text{Cl}$$

$$1 \text{ L} \rightarrow 1000 \text{ mL} \times 1.0 \frac{\text{g}}{\text{mL}} = 1.0 \times 10^3 \text{ g solution}$$

$$\frac{5.6 \times 10^{-5} \text{ g CH}_3\text{Cl}}{1.0 \times 10^3 \text{ g solution}} \times 10^9 \text{ ppb} = 56 \text{ ppb}$$

**Example:** What is the molality of a solution of methanol in water, if the mole fraction of methanol in it is **0.250**?

Assume 1 mol of solution:

$$\rightarrow n_{\text{meth}} = 1 \text{ mol} \times 0.250 = 0.250 \text{ mol}$$

$$\rightarrow n_{\text{water}} = 1 - 0.250 = 0.750 \text{ mol}$$

$$0.750 \text{ mol H}_2\text{O} \times \frac{18.0 \text{ g H}_2\text{O}}{1 \text{ mol H}_2\text{O}} \times \frac{1 \text{ kg}}{10^3 \text{ g}} = 0.0135 \text{ kg H}_2\text{O}$$

$$m = \frac{0.250 \text{ mol methanol}}{0.0135 \text{ kg H}_2\text{O}} = 18.5 \text{ m}$$

**Example:** What is the molality of a **1.83 M** NaCl solution with density of **1.070 g/mL**?

Assume 1 L ( $10^3 \text{ mL}$ ) of solution:

$$\rightarrow n_{\text{NaCl}} = 1.83 \text{ mol}$$

$$\text{mass of solution} = 10^3 \text{ mL} \times \frac{1.070 \text{ g}}{1 \text{ mL}} = 1070 \text{ g}$$

$$\text{mass of NaCl} = 1.83 \text{ mol} \times \frac{58.44 \text{ g NaCl}}{1 \text{ mol}} = 107 \text{ g}$$

$$\text{mass of water} = 1070 \text{ g} - 107 \text{ g} = 963 \text{ g} = 0.963 \text{ kg}$$

$$m = \frac{1.83 \text{ mol NaCl}}{0.963 \text{ kg H}_2\text{O}} = 1.90 \text{ m}$$

**Example:** What is the molarity of a **1.20 m** KOH solution in water having density of **1.05 g/mL**?

**Assume 1 kg (1000 g) of solvent (H<sub>2</sub>O):**

$$\rightarrow n_{\text{KOH}} = 1.20 \text{ mol}$$

$$\text{mass of KOH} = 1.20 \text{ mol} \times \frac{56.1 \text{ g KOH}}{1 \text{ mol}} = 67.3 \text{ g}$$

$$\text{mass of solution} = 1000 \text{ g} + 67.3 \text{ g} = 1067 \text{ g}$$

$$\text{volume of solution} = 1067 \text{ g} \times \frac{1 \text{ mL}}{1.05 \text{ g}} = 1016 \text{ mL} = 1.02 \text{ L}$$

$$M = \frac{1.20 \text{ mol KOH}}{1.02 \text{ L solution}} = 1.18 \text{ M}$$
